Heart and Coronary Arteries W. A. McAlpine 2012-12-06 The magnificent anatomical presentation in this book "The Heart and Coronary Arteries" has a unique importance for surgeons. It is a fundamental contribution to the anatomy of the heart and great arteries as well, because of the analytical, detailed, and imaginative anatomical approach of the author. While surgery from time to time is influenced by the development of new physiologic principles and techniques, methods of intra- and post-operative support, and diagnostic methodology, the excellence of its results con tinues to be related primarily to the precision and perfection of the operative procedure itself. The operative procedure can be precise and perfect only if it is based upon the surgeon's profound knowledge of normal anatomy, his understanding of the alterations in this normal anatomy by the pathol ogist with which he is dealing, and his ability to use this anatomic informa tion in organizing and effecting his surgical procedure. The cardiac surge geon, therefore, will find great rewards from intense study of this anatomic atlas. The cardiologist, the pediatric cardiologist, the anatomist, the pathologist, and students interested in cardiac disease will benefit to almost the same degree from a careful study of this work. Color Atlas of Human Anatomy Robert Matthew Hay McMinn 1978 The short notes that accompany many of the keys either make a comment on the particular items in the specimens for draw attention to general points in the region concerned. They are not intended in any way to provide a comprehensive description of everything seen; our aim is to supplement existing texts, not to substitute for them. In order to produce a volume of reasonable proportions both in size and in price we have had to be selective in choosing the illustrations from the material available to us. We have deliberately chosen a variety of cadaveric and museum specimens, since different methods of preparation and preservation give a range of appearances as far as colour is concerned, and the student must not imagine that all specimens will look the same no matter what they have been treated.
